Synopsis-Web Portfolio Resume

For my practical work, I'm going to build my own web portfolio that shows who I am as an ICT student and what I can do. The goal is to give people working in ICT companies a quick and clear picture of my skills, studies, experience, and projects.

The target audience is people involved in ICT hiring, such as recruiters, HR staff, developers, project managers, team leads, and internship coordinators. They may visit my portfolio when considering someone for an internship, trainee position, junior job, or future full-time ICT job. They may use a computer or mobile device, so information should be easy to find on both. I want to stand out by showing real projects and what I have actually built instead of only listing skills.

Projects will be the most important part of the portfolio. I plan to include work from my studies at Stadin Ammattiopisto and newer projects, such as the SomCat Community Website, the Sääksjärvi website, a Library Management System, and this portfolio itself. Each project will have a screenshot and a short explanation of what I built, the tools I used, and what I learned.

The site will have six main pages: Home, About, Projects, Skills, Experience/Education, and Contact. Home will introduce me, About will explain my background and goals, Projects will show my work, Skills will show the technologies I know, Experience/Education will present my studies and experience, and Contact will make it easy to reach me. I am the developer of the whole website.

I will build the site myself in Visual Studio Code using HTML5, CSS, Sass, and JavaScript. I won't use ready-made templates or frameworks such as Bootstrap. Sass will be organized into smaller files and compiled into one external CSS file. JavaScript will be used for small interactive features such as the mobile menu and form validation. I will use semantic HTML and responsive layouts. I plan to publish the site on JAMK Labranet, GitHub, and Netlify.

I want the design to be modern but simple, with a clean color palette, readable fonts, clear headings, enough empty space, and project screenshots. I will make desktop and mobile wireframes before coding. I will test the finished site in Firefox, Chrome and Microsoft Edge and validate the HTML.

The site will not collect unnecessary personal information, and I will only publish suitable professional contact details. Most images will be my own screenshots. For any external icons, pictures, fonts, or other material, I will check the usage rights and give credit when needed. I will update the portfolio when I learn new skills, complete projects, or gain experience.
